Online on Creational Pattern

Time: 20 minutes

You are developing a report-processing application. The system supports PDF, Word, and HTML reports. All report types implement a common interface Report with methods open() and generate().

The general report-processing steps are the same:

1. Create the report object.
2. Open the report.
3. Generate the report.
4. Display a completion message.

However, different report processors should decide which concrete report object is created.

Task: Implement the system so that the common processing steps are defined once, while specialized processor classes create the required report type.

- The general processor must not directly instantiate PDF, Word, or HTML reports.
 - Adding another report type should not require changing the common processing steps.
 - Simple print statements are sufficient.
-
